This map depicts the vehicle thefts in the CMA of Vancouver. The candidate police site is placed in an area with a high number of vehicle thefts on all three aggregation levels (Census Tracts, Dissemination Areas, and Local Area Boundaries). Out of 839 vehicle thefts, 623 took place within 5 km of the proposed police station site.

This map depicts the number of vehicle thefts per 1000 individuals aggregated by the census treacts of CMA Vancouver. The candidate police site is placed is an area with a high number of vehicle heists on all three aggregation levels (Census Tracts, Dissemination Areas, and Local Area Boundaries). Out of 839 vehicle thefts, 623 took place within 5 km of the proposed police station site.

Lab 2 Part B Report

During this lab, we aggregated the number of vehicle thefts in Vancouver on the Dissemination Area, Census Tracts and Local Area Boundaries level. By visualizing the crimes at different scales, each map depicts a different perception of the same reality. For example, the crimes aggregated at the census tracts-level make the whole north side seem to have intense crime density. However, when aggregated by Dissemination Area (which is more specific), it became apparent that not all areas in the North of Vancouver have a high concentration of vehicle theft—some areas in the north are safer than others. This difference in areal unit changed the perception of where the crime is taking place. Using all four maps, we placed our police station in North Vancouver. The station was placed so it is within 5 kilometers of 623 of the vehicle thefts out of the 839 total vehicle thefts in 2021.
